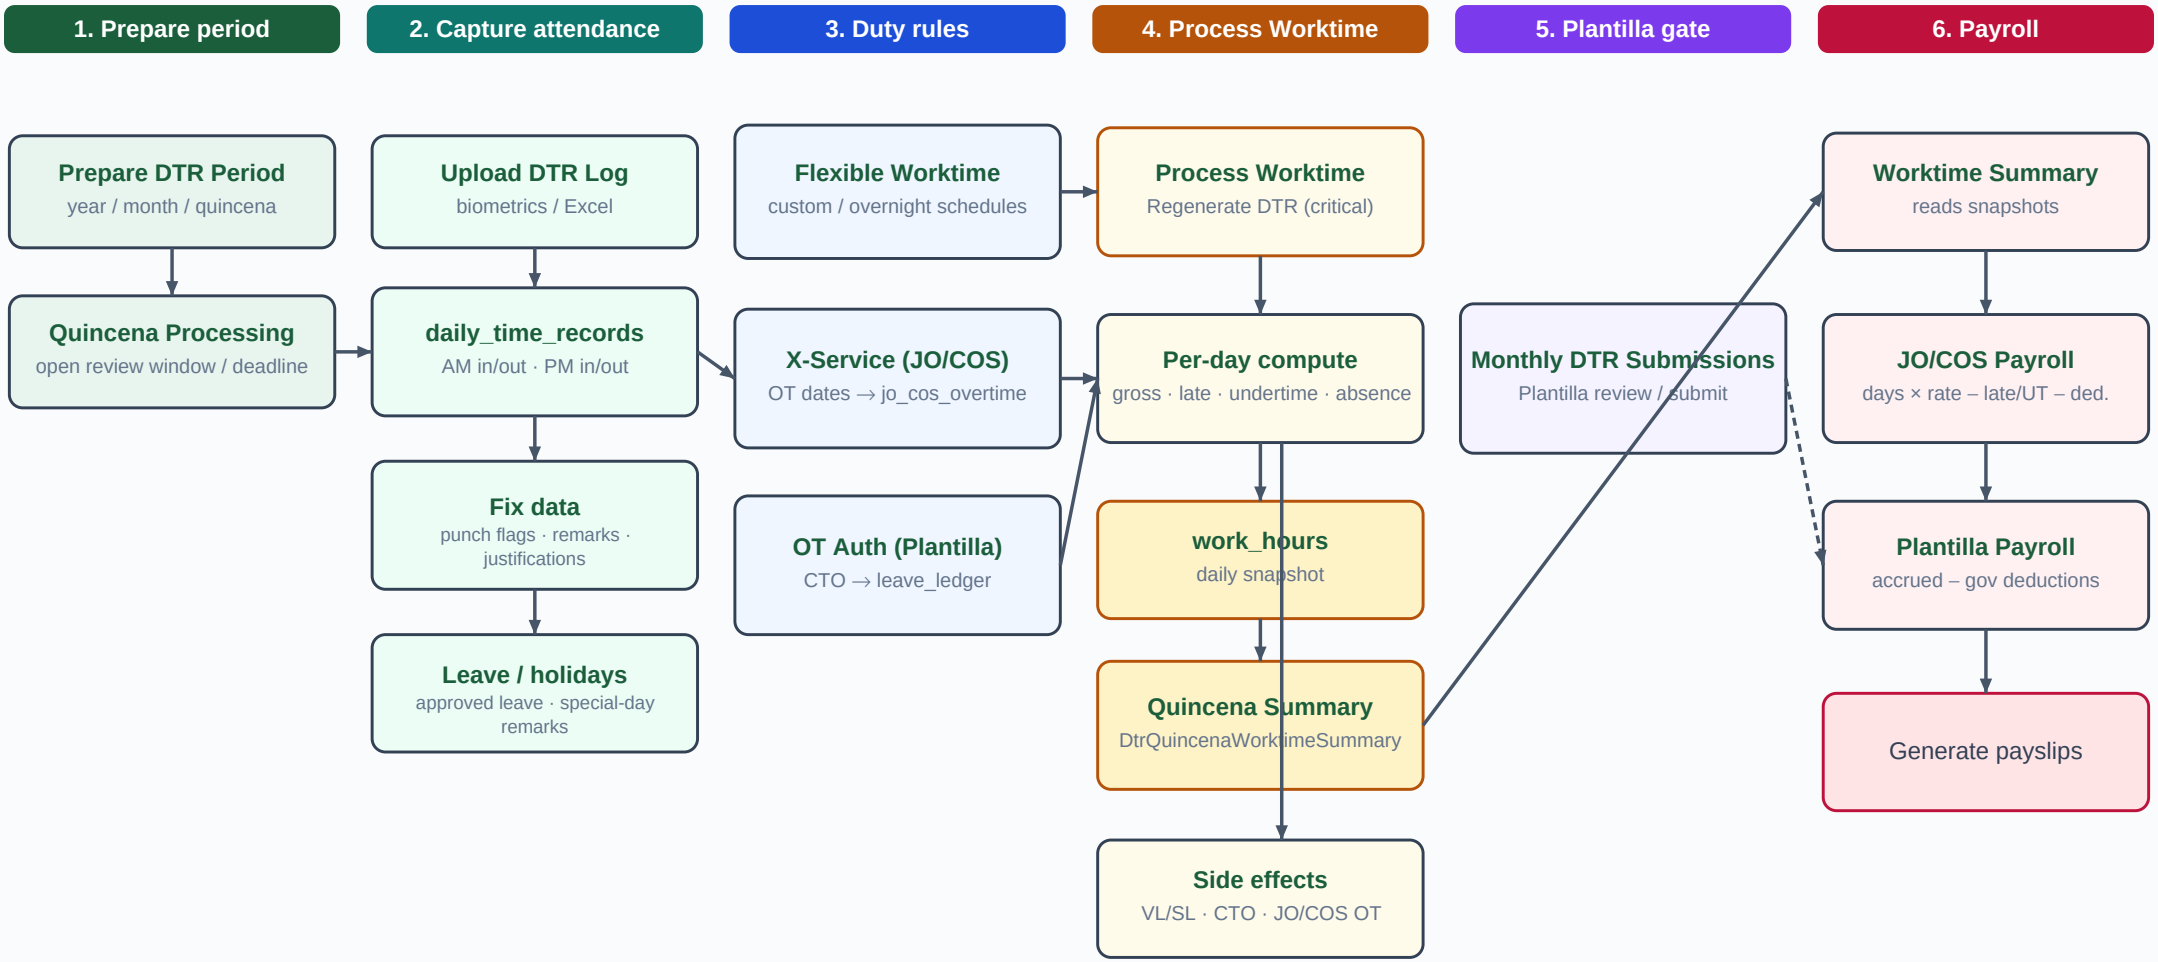
HRMS — DTR Process to Payroll

LGU Jagna · Quincena workflow

Payroll reads quincena snapshots (work_hours + DtrQuincenaWorktimeSummary) produced by Process Worktime — not live punches each pay run.



Operator sequence

1) Prepare DTR Period → open Quincena Processing
2) Upload DTR → fix flags / remarks / justifications
3) Set Flexible Worktime, X-Service (JO/COS), OT Auth (Plantilla) if needed
4) Run Process Worktime (writes snapshots payroll uses) → 5) Check Worktime Summary → 6) JO/COS or Plantilla payroll → payslips

Re-run Process Worktime after changing flexi schedules, X-service, or punches for that quincena — otherwise payroll still sees the old snapshot.

What Process Worktime computes

JO/COS track

Pay base
Gross work minutes ÷ shift length (480 min default, or flexi average) → paid days (rounded) × daily rate

Late / undertime
Deducted separately from gross (not from net-rendered minutes)

X-Service OT
Authorized dates excluded from regular worktime; credited to jo_cos_overtime when punches fall in windows

Snapshot used
work_hours + DtrQuincenaWorktimeSummary for the selected quincena

Plantilla track

Pay base
Accrued from appointment / schedule; plantilla net worktime = gross (VL via leave_ledger)

Late / leave
Leave deductions and CTO posted on leave_ledger during regeneration

OT Authorization
Does not change work_hours; earns CTO only for punches inside authorized windows

Monthly gate
Monthly DTR Submissions used where plantilla review/submit is configured

Critical handoff

Process Worktime (_run_dtr_quincena_regeneration) writes one work_hours row per employee per calendar day in the quincena, plus quincena totals. Worktime Summary, JO/COS Payroll, and Plantilla Payroll read these snapshots for the selected year / month / quincena half.

After changing Flexible Worktime, X-Service, OT Auth, or punches — re-run Process Worktime before payroll.
